

RADIODETECTION® 

# Earth Mat

Enhance locating safety  
and minimise risk

# The Earth Mat – designed to provide enhanced safety for locating and digging operatives.

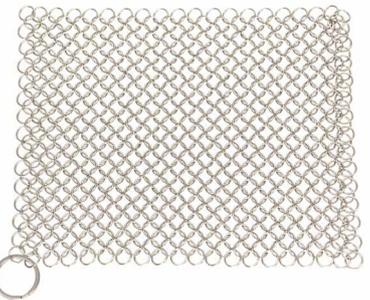

Designed primarily with your safety in mind, the Earth Mat is a new way for your Transmitter or Genny® to connect to ground. Inserting an Earth Stake without scanning carries a risk of striking a buried utility; the Earth Mat helps you minimize these risks.

## Easy to use

Simply lay the Earth Mat out flat on the ground and connect the Transmitter or Genny Earth Lead. Pour a little water on the Earth Mat for an improved signal and start scanning immediately – more quickly and more easily than ever before.

The Earth Mat is also **very useful on surfaces such as concrete and asphalt, where it is difficult to insert an Earth Stake.**

Radiodetection recommends that you use an Earth Stake in the normal way, if the surface allows it, once you have completed a safety scan with the Earth Mat to make sure that the Stake is safe to use.

The Earth Mat is a stainless steel wire mesh measuring 17cm / 7" square.
